INTRODUCTION

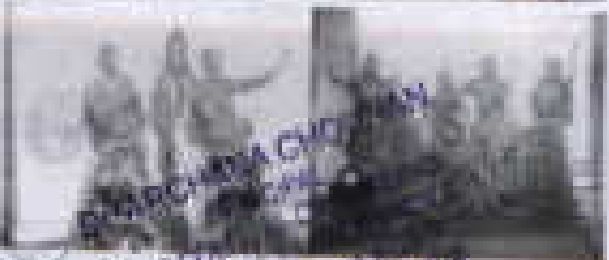

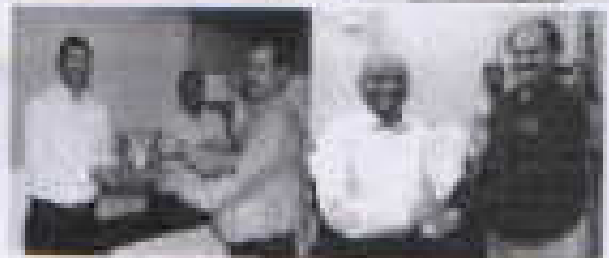

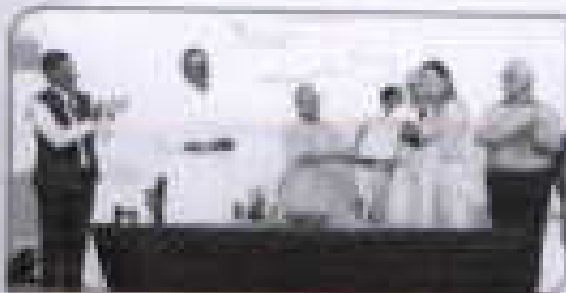

It is a matter of great pleasure to invite you to attend International Conference Organized by Baba College of Nursing Lucknow on 12th & 13th August 2023.

The Baba College of Nursing & Institute of Paramedical founded by Mr. A. K. Vajpayee and is managed under Baba Educational Society established in the year 1999. Courses running under this society are ANM, GNM, B.Sc. Nursing, M.Sc. Nursing and other Paramedical courses. Baba College of Nursing is accredited by the National Assessment and Accreditation Council (NAAC) since 2022.

The College of Nursing earned itself the title of being the only first MENTOR INSTITUTE in Lucknow and Awarded by Hon'ble Chief Minister Shri. Yogi Adityanath under Mission Niramaya in 2022. After Mission Niramaya, Baba College is fulfilling its responsibilities of being a mentor institute and is constantly striving to take its standard and speed activities of the college to a new level. Also our Baba College of Nursing received the prestigious grading 'A' from Quality Council of India under Mission Niramaya.

Our institute is also a part of Student Nursing Association and involved in the various activities organized by SNA. Baba Educational Society is dedicated towards working for welfare of Society since so long. The atmosphere of this institute is Conducive to creative and productive learning. The college really cares its members. It is a place of civility, friendship and good cheer.

This conference brings together renowned professionals from all over the world to exchange information and experience on various modalities of Natural Birth.

BABA COLLEGE OF NURSING & INSTITUTE OF PARAMEDICAL

PARAMEDICAL COLLEGE OF NURSING.**

PROF. (DR.) ARCHANA CHOUDHAN

ABSTRACT - Nomophobia is considered a modern age phobia introduced to our lives as a by product of the interaction between people and mobile information and communication technologies, especially smartphones. This study sought to contribute to the nomophobic research literature by identifying and describing the dimensions of nomophobia and developing a questionnaire to measure nomophobia. Mobile phones are changing behaviour, relationships, communication and the dynamics of physical environments. As such, reliance on the device for everyday activities has increased. Consequently, "nomophobia", defined as the fear of being without one's mobile phone, has emerged as a new phobia. The current study aimed to determine if nomophobia can increase the likelihood of problematic dependent, prohibited and dangerous mobile phone use. Mobile phone use has increased markedly over the past 5 years and has been related to "no mobile phone phobia" (so-called nomophobia). The 20-item Nomophobia Questionnaire (NMP-Q) is the only instrument that assesses nomophobia. Technological progress not only brings with it resources that improve and facilitate the day-to-day life of the people who make up society but also entails health risks, with the emergence of terms, such as nomophobia, which is considered an anxiety disorder produced by the fear that not having a mobile phone generates in a person.

INTRODUCTION - Nomophobia is defined as the fear of being without a mobile phone or unable to use it. "Nowadays, it is considered a modern age phobia." It is to be considered as a form of behavioral addiction.

Nomophobia, a state of sociopsychological illness, refers to a fear of lack of access to mobile phone, which is thought to be a modern age disorder that causes negative health risks and harmful psychological effects. This study aimed to determine the relationship between the smartphone-use and nomophobia disorder among medical professionals. Nomophobia is No Mobile Phone Phobia - the fear of being without a mobile device or beyond mobile phone contact. The time and money wastage by medical professionals is a negative aspects of mobile phone dependence. This time can utilized for academic and recreational activities. Smartphones make it possible to perform a variety of daily tasks in one device, including, but not limited to, calling and texting people, checking and sending

PARAMEDICAL COLLEGE OF NURSING
CHANDLER, LUDHIANA, PUNJAB
INDIA

email messages, scheduling appointments, surfing the Internet, shopping, social networking, searching for information on the Internet, gaming, entertainment, etc. (Park, Kim, Shim, & Shim, 2017). Because smartphones are ubiquitous and provide numerous capabilities, Kang and Jung (2014) propose that smartphones go beyond serving communication, information and entertainment purposes. They state that smartphones enable people to "fulfill needs such as learning, individual capability, safety, and human relationships" (Kang & Jung, 2014, p. 177), which is attributed to the mobility of smartphones. While the mobility of smartphones provides apparent benefits and enable individuals to satisfy their basic needs (Kang & Jung, 2014), it may also induce some problems associated with smart-phone use. Previous studies have shown that smartphones may cause compulsive checking habits (Christovara et al., 2012), that smartphones . The use of smartphones has increased, and this has made smartphone addiction a significant public health concern in recent years. Nomophobia is considered a disorder of the contemporary digital and virtual society. In general, it is the pathological fear of remaining out of touch with technology. The portable smartphones allow for shorter use periods of multiple internet-based mobile applications ("apps") in contrast to relatively long periods of computer-based internet use. Smartphone addiction has been considered to be a technological addiction, which is defined as behavioral addictions of a technological nature that involve human-machine interaction.

Nomophobia has been observed as a growing fear and problematic consequences of mobile phone use in young adults. It is a term used to describe by combining phobia and no mobile phone use where the individuals might experience anxiety, discomfort, nervousness and anguish out of fear of not being in contact with their technology.

Other characteristics that individuals might show include spending most time using mobile phone (on average 34 times a day) always keeping it switched on, sleeping in bed with it, looking at the screen to check calls and messages, feeling anxious at the thought of losing or misplacing phone, or apprehensive when it is not charged, or has no signal coverage. It is a newly emerging psychiatric disorder among mobile phone users.

Mobile phone use severely damaging to our health, both physically and mentally. The characteristic symptoms of nomophobia include overuse of a mobile phone and the resultant feeling of disorientation when there is a lack of network coverage, the battery is out of power, or the balance between the two is not enough. In addition, people with nomophobia would frequently check their phones for messages or missed calls, and they are reportedly under the illusion of hearing a mobile phone ring or vibrate. All these symptoms

Dr. ARCHANA CHOUHAN
Principal
BABA COLLEGE OF NURSING
INSTITUTE OF MANAGEMENT &
COMMERCE GROUP
CHANDI, LUDHIANA-141002

because of the problematic use of a mobile phone would inevitably affect people social life, work productivity, and academic performance in a negative way.

To evaluate this situational phobia status affecting mobile phone users, Yıldırım and Cornia first developed the Nomophobia Questionnaire (NMP-Q) in the United States in the English language as an effective instrument.

OBJECTIVES-

- 1) To assess the level of Nomophobia of Medical professional of MCH wing and Bata Educational Society Institute of Paramedical College of Nursing.
- 2) To find out association between level of Nomophobia with selected demographic variables.

HYPOTHESIS-

H0 - There is no significant relationship between level of Nomophobia and selected demographic variables.

H1- There will be significant relationship between level of Nomophobia and selected demographic variables.

DELIMITATION OF THE STUDY -Every study is not complete in itself and it is bound to have

Some limitation which is depends on resources of the investigator and they are termed as delimitation of the study. Following are the delimitation of the present study -

The present study is limited to a random sample of 40 Medical Professional from Lucknow UP; hence the result obtained might not be same if the sample had included other state of the country. This is done because it was not possible to investigator to include other state due to limited resources and potentialities.

The present study is confined to the medical professionals only.

The study is confined to variables under consideration. Other additional variables may be included but due to limited time, resources and potentialities by investigator only the variables related to nomophobia are included in the present study.

POPULATION OF THE STUDY-According to Polit "A population is the entire aggregation of the most designated set of criteria. Population for a studies look at

Dr. ARCHANA CHOUDHARY
Professor
SABA COLLEGE OF NURSING
INSTITUTE OF PARAMEDICALS
OF MEDICAL SCIENCES
GENERAL LUCKNOW-226028

accommodates the complete aggregate of factors where wherein researcher is interested and in which the end result of the study may be implemented. The population of the study consisted of This study population comprise of Medical professionals from MCH wing and Baba Educational society, Institute of paramedical college of Nursing, Lucknow, Uttar Pradesh. But researchers can not perform the research on total population so in this study the accessible population is 40 Medical professionals of MCH wing and Baba educational society, Institute of paramedical, college of Nursing Lucknow, Uttar Pradesh.

SAMPLE- sample is subset of population decided on take part in a studies study investigators select a sample of 40 Medical professionals at MCH wing and Baba Educational society Institute of paramedical, college of Nursing Lucknow Uttar Pradesh.

Pattern of the assessment of level of Nurophobia in Medical professionals from MCH wing and Baba educational Society Institute of Paramedical College of Nursing at Lucknow district those who fulfilled the inclusion criteria . The 40 Medical professionals were selected through random sampling technique.

SETTING OF THE STUDY- This study is conducted in MCH wing and Baba Educational society, Institute of paramedical, college of Nursing, Lucknow, Uttar Pradesh.

SELECTION OF MEDICAL PROFESSIONALS- After selection of the Institute, Medical professionals are selected from MCH wing and baba educational society Institute of paramedical college of nursing Lucknow were selected randomly.

SAMPLING TECHNIQUES-A total 40 Medical professionals of MCH wing and Baba educational society, Institute of paramedical, college of Nursing, Lucknow, Uttar Pradesh was selected by random sampling technique.

VARIABLES-A variable that is selected or controlled by researcher determine its relationship to observed outcome of research.

Pillit and Hungler (1999) – A variable is the name implies, something that varies.

Demographic variables-

Demographic variables are used to describe the nature of samples derived from populations. In these study demographic variables is Age, Religion, Mother Education, Father Education, Family Income, Socioeconomic Condition, Living area, Source of Knowledge.

DATA COLLECTION-Recorded data been accumulated via Nurophobia Questionnaire (NMP- Q) technique. On this manner first, permission become obtained from the institutional authorities mainly from principal, earlier than the real statistics series method. The validity and reliability of the tool was obtain from professor, associate professor and

Dr. ARCHANA CHOUDHAN
Principal
BABA COLLEGE OF NURSING
INSTITUTE OF PARAMEDICALS
IN MEDICAL CAMPUS
GHAZIABAD, UTTAR PRADESH

assistant professor working in the Baba educational society institute of paramedical college of nursing Lucknow conducting study. Data collection was planned for 14 JULY 2022 by using demographic variables. After that selected 40 sample for assessment of level of Nontophobia with the help of random sampling technique. The nontophobia questionnaire section included the 20 items developed as a result of the first, qualitative phase. All 20 items in NMP-Q are rated using a 7-point Likert scale, with 1 being "Strongly Disagree" and 7 being "Strongly Agree" only at the extremes. Total scores are calculated by summing up responses to each item, resulting in a nontophobia score ranging from 20 to 140, with higher scores corresponding to greater nontophobia severity. NMP-Q scores are interpreted as follows an NMP-Q score of 20 indicating the absence of nontophobia; an NMP-Q score greater than 20 and less than 60 corresponding to a mild level of nontophobia; an NMP-Q score greater than or equal to 60 and less than 100 corresponding to a moderate level of nontophobia; and an NMP-Q score greater than or equal to 100 corresponding to a severe Nontophobia.

RESULT AND DISCUSSION -Results are the findings or outcome which resolves the research question raised by the researcher at the beginning of study.

This chapter presents the analysis and interpretation of the data collected to determine the A Descriptive design to assess the level of Nontophobia of Medical professionals of MCH wing and Baba educational society Institute of paramedical college of nursing, Lucknow by using Nontophobia Questionnaire scale.

Analysis is the process of organizing and synthesizing the data in such a way that research questions can be answered and hypotheses tested. The purpose of the analysis is to reduce the data into an intelligible and interpretative form so that the relation of research problem can be studied and tested.

Analysis and interpretation of data collected from 40 medical professionals were done based on the objectives and hypotheses of the study using descriptive and inferential statistics.

The primary objective shows that level of Nontophobia in Medical professionals in this there are 0% people is having absence of Nontophobia and 0% people having mild level of Nontophobia and 19% people is having Moderate level of Nontophobia and 13% people is having severe level of Nontophobia. And in this study H₀ is accepted because of no significant relationship between the level of Nontophobia with selected demographic variables.

Dr. ARCHANA CHOUDHARY
Principal
BABA COLLEGE OF NURSING
INSTITUTE OF PARAMEDICALS
CAMPUS, LUCKNOW-226028

There is no significant relationship between level of Nomophobia and selected demographic variables of Medical professionals such as Age, Religion, Mother Education, Father Education, Socioeconomic condition, living area and previous knowledge on Nomophobia.

There is significant relationship between level of Nomophobia and selected demographic variables of Medical professionals such as family Income.

Abstract

Introduction: Overall development of a country is incomplete without women who contribute nearly half of the human resource potential available. If proper care is not taken during the childbearing process, then it affects the overall health especially the reproductive health of the woman as well as the health and well being of the newborn child. In real sense, the place of delivery is an important aspect of reproductive health care provided to the mother and the quality of care received by the mother and the newborn baby depends upon the place of delivery.

Materials & Methods: Conceptual framework of the study is based on Health Belief Model developed by Becker's (1984). It include individual perception, modifying factors and threshold action (THA) based on the problem statement and objective of the study. A sample of 60 mothers in both Urban and Rural areas of Baran District, Rajasthan selected by purposive sampling technique. Data were collected semi-structured questionnaire. Data were analyzed using comparative and inferential statistics and representation in graph and table.

Results: In the present study the mean of positive belief of both urban and Rural mothers are 29.27 and 24.8. Standard Deviation is 7.74 for urban mother's and 8.187 for rural mother's. Coefficient variation is 0.1976 for urban mother's and 0.2350 for rural mother's, and t -test value is 2.017 and their P value is 0.0992, we can say that it is highly significant. This reject the null hypothesis. The value of correlation is 0.9871 which lies between 0 and +1, therefore the null hypothesis get rejected.

Conclusion: Mother's had high negative belief score about institutional delivery in rural area, mother's have high positive belief about institutional delivery, have moderate positive belief and have mild positive belief and mother had mild negative belief in urban area, mother had moderate negative belief score and had high negative belief score about institutional delivery in urban area.

Keywords: Comparative study, beliefs, purposive sampling technique

Introduction

Mothers Reflect God's loving presence on earth."—William R. Webb

Motherhood is such a blessing in woman's life, that a loving mother, she forgets her own self for the tender love of her dear one and trains her children in virtue. The bond between a mother and her child is a powerful component in a child's life. Motherhood is a wonderful time experienced by a woman beginning with pregnancy. Motherhood continues throughout the child's life and never ends. But mothers who die during child birth or before the birth of a baby leave behind their never ending hopes, their children and families and numerous reasons as to why their lives ended so early.

Pregnancy is a physiological process but also a period of potential risk leading to complications during labor, delivery, and post natal period. The provision of care for women during pregnancy and childbirth is essential to ensure a healthy and successful outcome of pregnancy for both mother and her newborn. Maternal mortality is a global burden, lots of women dying due to pregnancy and childbirth-related complications. Birth-preparedness and complication readiness is a comprehensive strategy to improve the use of skilled providers at birth, the key intervention to decrease maternal mortality.

Maternal mortality and increased overall health status of the mother and the child. Institutional delivery means giving birth to a child in a medical institution under the overall supervision of trained and competent health personnel where there are more amenities available to handle the situation and save the life of the mother and child. If the child is born at home, then chances of getting infected from unhygienic environment are more and it is very tough and sometimes impossible to handle child birth complications. In India, it is a prevalent practice to deliver the child at home instead of taking the pregnant women to some health facility. This is more common in rural areas as compared to urban areas. Institutional births result in reduced infant and maternal mortality and increased overall health status of the mother and the child.

Reduction in maternal and child mortality has been a top priority in India, especially in light of the commitment on the part of the national government to the reach the Millennium Development Goals. A major reason for this high MMR is home delivery of pregnant mothers, often by unskilled traditional birth attendants (TBAs), relatives or neighbors. It is needless to mention that institutional delivery is an essential measure for preventing maternal death, which is still underlined by Indian women. Recent analysis of third National Family Health Survey (NFHS-3) shows 13% of the women in the lowest wealth quintile accessing institutional delivery care compared with 84% in the highest.

The importance to proximity to health services as a factor affecting utilization has also been stressed. Institutional births result in reduced infant and maternal mortality and increased overall health status of the mother and the child.

Many programs in India like the Child Survival and Safe Motherhood (CSSM) and the Reproductive and Child Health (RCH) programme are focused on this aspect. Under these programs, encouraging deliveries in proper hygienic conditions only by trained health staff and to provide better health care to the mothers and children are emphasized. Our government's commitment in this direction is reflected in the goals of the National Rural Health Policy (NRHP), National Health Policy (NHP), and the National Rural Health Mission (NRHM) launched by the Honorable Prime Minister of India on 12 April 2005. The NRHM has a safe motherhood intervention programme (Janani Suraksha Yojana- JSY). The objective of JSY is to reduce Maternal Mortality Ratio (MMR) and Neo-natal Mortality Ratio (NNMR) through the provision of institutional deliveries.

DR. ARCHANA CHOUDHARY
 PROFESSOR IN MATERNAL & CHILD HEALTH
 INSTITUTE OF POSTGRADUATE MEDICAL EDUCATION
 RAIPUR-209001

Statistical Analysis of Urban Mothers showed those 35.00% Scored Moderate beliefs, 48.33% Scored High belief regarding preference of institutional delivery and 16.67% Scored Mild belief, 33.33% Scored Mild belief, 63.33% Scored Moderate belief and 3.33% Scored High belief regarding ignorance of institutional delivery.

The First objective was to assess the mother's beliefs towards the preference of Institutional Delivery in urban area.

The aim of this study was to compare the Beliefs of rural and urban Mother's towards the preference of Institutional Delivery.

Results
 Population: Selected for present study was all mother's who had given birth in the past year.

Setting for the study: Selected for the study are the rural and urban areas of district Barran. The rural area is village Siswail and the urban area is Awa of district Barran.

Sampling techniques: Purposive sampling technique was adopted for selection of subjects for the study.

Sample and sample size: Considering the data saturation and time available for the data collection, it was decided to include 60 subjects in the study in both urban and rural area. This sample size was considered adequate for the study analysis & to make valid generalizations.

Methods of data Collection: Semi-structured interview schedule.

Research design: The research design selected for the present study is qualitative research design.

Research approach: A phenomenological approach was found to suit best.

Materials & Methods

H₁: There is significant association between demographic variable and beliefs of mother's residing in rural area towards the preference of institutional delivery.

H₂: There is significant association between demographic variable and beliefs of mother's residing in urban area towards the preference of institutional delivery.

H₃: There is no correlation between belief score of rural and urban mothers towards the preference of institutional delivery.

Hypothesis

01. To observe the mother's beliefs towards the preference of institutional delivery in rural area.

02. To observe the mother's beliefs towards the preference of institutional delivery in rural area.

03. To compare the mother's beliefs towards preference of institutional delivery in urban and rural area.

04. To observe the co-relation between the mother's belief between urban and rural area.

Objectives

Second objective was to assess the mother's belief towards the preference of Institutional Delivery to rural areas.

Statistical Analysis of Rural mother's showed that 41.67% Scored Moderate belief, 26.67% Scored High belief and 31.67% Scored Mild belief regarding preference of the institutional delivery and 20.00% Scored Mild belief, 68.33% Scored Moderate belief and 11.67% Scored High belief regarding ignorance of institutional delivery.

The Third objective was to compare the mother's belief towards the preference of Institutional Delivery in urban and rural areas.

Statistical Analysis showed that mean preference of institutional delivery belief score of rural mothers are less than Mean preference of the institutional delivery belief score (34.3) (39.17) of urban mothers towards the preference of Institutional Delivery with the preference of Institutional Delivery belief Standard Deviation 8.187 (Rural Mother's), 7.74 (Urban Mother's). Z value of preference of Institutional Delivery belief 3.013. Mean towards the ignorance the institutional delivery belief score (19.22) of rural mothers are given then Mean towards the ignorance the institutional delivery belief score (14.72) of urban mothers towards the ignorance the institutional delivery with the towards the ignorance the institutional delivery belief Standard Deviation 8.17 (Rural Mother's), 7.64 (Urban Mother's). Z value of towards the ignorance the institutional delivery beliefs 3.125 indicate that calculated Z value is more than tabulated Z value so null hypothesis rejected and alternative hypothesis accepted that there is difference between beliefs of Rural Mother's and Urban Mother's towards preference and ignorance of Institutional Delivery. P= value (0.992), indicates that the difference extremely statistically significant.

The Fourth objective was to observe the Co-relation between the mother's belief between urban and rural areas.

Statistical Analysis showed that there is partial preference of institutional delivery co-relation of mother's preference of institutional delivery belief between urban and rural mothers with preference of institutional delivery Mean 39.8 (Rural Mother's), 39.17 (Urban Mother's) and preference of institutional delivery Standard Deviation 8.187 (Rural Mother's), 7.74 (Urban Mother's). Statistical Analysis of partial preference of institutional delivery co-relation of mother's preference of institutional delivery belief between urban and rural mother's was 0.9874 and preference of institutional delivery Co-efficient variation of Rural Mother's 0.2350 and Co-efficient variation of Urban Mother's 0.1976.

There is partial co-relation of mother's towards the ignorance the institutional delivery belief between urban and rural mother's with towards the ignorance the institutional delivery Mean 19.22 (Rural Mother's), 14.72 (Urban Mother's) and towards the ignorance the institutional delivery Standard Deviation 8.17 (Rural Mother's), 7.64 (Urban Mother's). Statistical Analysis of partial Positive co-relation of mother's negative belief between urban and rural mother's was 0.9320 and towards the ignorance the institutional delivery Co-efficient variation of Rural Mother's 0.4250 and Co-efficient variation of Urban Mother's 0.3010.

Major Findings of the study

Section-I

- A-1-Analysis of rural mother's demographic characteristics
- 46.67% of the mother's belongs to age group 26-32 years, 31.67% belongs to 18-25 year age group and 21.67% belongs to 31-67% age group.
- 88.33% were married, 6.67% were divorced and 21.67% were above 32 year.
- 8.33% were illiterate, 46.67% were primary educated, 8.33% illiterate, 21.33% secondary educated, 28.33% senior secondary educated.
- 50% belonged to rural area.
- 48.33% were Hindu, 50% were Muslims and 1.67% were other religion.
- 1.33% husband were illiterate, 33.33% were primary educated, 13.33% were secondary educated, 25% were senior secondary educated, 25% were graduate.
- 24% were having incomes less than Rs.500/month, 58% belonged to income group of 500-10,000 and 17% belonged to income group of 10,000-20,000.
- 53.33% had 1-2 pregnancy in her life, 16.67% had 3-5 pregnancy in her life.
- 51.67% mother's delivered her baby at home, 48.33% mother's delivered her baby at hospital.

B-Analysis of urban mother's demographic characteristics

- 28.33% mother's belongs to age group 18-25 year, 41.67% mother's belong to 26-32 year, 30% mother's belongs to age group = 32 year.
- 65% were married, 20% were divorced, 15% were widow.
- 11.67% were illiterate, 26.67% were primary educated, 28.33% were secondary educated, 33.33% were senior secondary educated.
- 58.33% were Hindu, 15% were Muslim, 15% were Christian, 11.67% were Other religion.
- 3.33% husband were illiterate, 10% were primary educated, 23.33% were secondary educated, 25% were senior secondary educated, 38.33% were graduate.
- 36.67% were having income less than Rs.5,000/month, 30% belongs to income group of 5,000-10,000/month, 20% belongs to income group of 10,000-20,000/month and 13.33% belongs to income group of more than 20,000/month.
- 60% had 1-2 pregnancy in her life, 38.33% had 3-5 pregnancy in her life, 1.67% had more than 5 pregnancy in her life.
- 31.67% mother's delivered her baby at home and 68.33% mother's delivered her baby at hospital.

Section II

- 31.67% mother's had mild belief score towards the preference of the institutional delivery in belief related questionnaire in rural area, 41.67% mother's had moderate towards the preference of the institutional delivery belief score and 26.67% mother's had high towards the preference of the institutional delivery belief score, 20.00% mother's had mild towards the preference of the institutional delivery belief score in belief related questionnaire in rural area, 68.33% mother's had moderate belief score and 26.67% mother's had high belief score towards the ignorance of the institutional delivery.

- Similar study can be conducted by using quantitative research design.
- Similar study can be done in hospital settings.
- Similar study can be done on a large scale.
- More and relevant information should be provided through mass media on institutional deliveries.

Recommendations:

- 48.33% mother's have high belief about institutional delivery, 35% have moderate belief and 16.67% have mild belief towards the preference of the institutional delivery and had high belief score about ignorance of the institutional delivery in urban area.
- 41.67% mother's have moderate belief about institutional delivery, 31.67% mother's have moderate belief and 26.67% mother's have high belief towards the preference of the institutional delivery and 20.00% mother's had mild belief score in belief related questionnaire in rural area, 68.33% mother's had moderate belief score and 26.67% mother's had high belief score about ignorance of the institutional delivery in rural area.
- 46.67% & 41.67% mother's belongs to age group 25-32 years in both urban and rural area.
- 88.33% & 65% of the mother's were married in both area rural and urban.
- 40% mother's primary educated in rural area and 33.33% mother's sec. secondary level educated in urban area.
- 41.67% mother's have moderate belief about institutional delivery, 31.67% mother's have moderate belief and 26.67% mother's have high belief towards the preference of the institutional delivery and 20.00% mother's had mild belief score in belief related questionnaire in rural area, 68.33% mother's had moderate belief score and 26.67% mother's had high belief score about ignorance of the institutional delivery in rural area.

Conclusions

- 16.67% mother had mild belief in urban area, 35% mother had moderate belief score and 48.33% had high belief score towards the preference of institutional delivery, 33.33% mother had mild belief in urban area, 63.33% mother had moderate belief score and 3.33% had high belief score towards the ignorance of the institutional delivery.

How to cite this article: Hemendra Pal Singh: A Study to Evaluate the Effectiveness of Structured Teaching Programme on Knowledge Regarding Child Abuse among Mothers in Gansara Village, Bharatpur (Rajasthan). GJNPSS-JMIR 2023; 4(6): 2292-2298
Received: 14 July 2023, Accepted: 25 June 2023, Published: 4 July 2023

Abstract

Introduction: Child abuse is a serious problem that has a significant long term impact on individual, families, and community. Raising awareness and understanding of child abuse is the first important step towards addressing the issue. Originally the term 'child abuse' was restricted to the injured baby syndrome but it has now been extended to a deliberate act of physical, actual, emotional and maltreatment or neglect of children by parents, guardians or others. **Materials & Methods:** In this study, pre experimental "one group pre and post test design" used to evaluate the effectiveness of structured teaching programme on knowledge regarding child abuse among mothers.

Results: Association test between the post-test level of knowledge with the selected demographic variables shows the significant association between post-test levels of knowledge with educational status of mothers. The χ^2 value was 11.15. This was significant at P=0.05 level. There was no significant association between the level of knowledge with age, occupation, monthly income, number of children, type of family and source of information regarding child abuse.

Conclusion: If children are educated, healthy, happy and have access to opportunities, they are the country's greatest human resource. Children are the treasures of a nation. They are to develop our citizens and leaders of tomorrow. Healthy children are the greatest resource and pride of any nation. Investment in the children's development and safety is an investment in the future of the nation. Thus their health and development must be monitored at every step of their life. They deserve to inherit a better

Key words: structured teaching programme; Knowledge; child abuse

Introduction

Before you meet a child be sure you yourself are not the cause of offence

- Austin O'Malley

Worldwide, there are three million reports of child abuse and neglect per year. However, experts view it that the actual number is 3 times the amount of child abuse and neglect estimated. It is a sensitive issue that is rarely openly discussed by the general people. Sadly, there is a significant underestimation by the community of the extent and nature of the problem. Child abuse also known as *child maltreatment, child neglect, parental dysfunction, stressor's syndrome*.

The first case of a tortured child found by Samuel West in 1888, but it was misdiagnosed as due to ticks. Infanticide was well known in China, Rome and Greece. In India the first case of child abuse was described in 1967 by Indian literature. And there is a lack of general awareness of Child Abuse and Neglect (CAN).

According to World Health Organization (WHO), "Child abuse or maltreatment constitutes all forms of physical or emotional ill-treatment, sexual abuse, neglect or negligent treatment or survival, development or dignity in the context of a relationship of responsibility, trust or power".

Child abuse is a state of emotional, physical, economic and sexual maltreatment noted out to a person below the age of eighteen and is a globally prevalent phenomenon. However, in India, as in many other countries, there has been no understanding of the extent, magnitude and kinds of the problem. The growing complexities of life and the dramatic changes brought about by socio-economic transitions in India have played a major role in increasing the vulnerability of children to various and newer forms of abuse. Child abuse has serious physical and psycho-social consequences which adversely affect the health and overall well-being of a child.

The world health organization (2001) reported approximately 11,000 deaths recognized in homicide among children less than 15 years of age. In 2002 it has reported that almost 53,000 child deaths in the year were due to child homicide. Each year more than 40 million children are subjected to child abuse.

UNICEF journal of India (2011) reported that each year tens of thousands of children are maltreated by physical, sexual and emotional abusers or by care givers who neglect them. Leder, D. Bismar (2011) noted in times of India news paper that every 2.5 hours a child below 10 years of age and every 15 hours a child below 10 years of age is raped in India, making it the country with the highest number of child sexual abuse of any country.

Global Prevalence of Child Sexual Abuse study conducted by The Centers for Disease Control and the U.S. (2011), 19.7% of women globally experienced sexual abuse prior to the age of 18. The highest prevalence rate of child sexual abuse geographically was found in Africa (34.4%), Europe showed the lowest prevalence rate (9.2%). America and Asia had prevalence rates between 10.1% and 23.0%.

child laborers among total children in the age group of 5-14 years, followed by Rajasthan 8.25 % and Himachal Pradesh (8.14%) during 2001. The other states having higher than the national average of 5 percent WPR for children are Andhra Pradesh (7.7%), Chandigarh (6.96%), Karnataka (6.91%), Madhya Pradesh (6.71%), J&K (6.62%), Arunachal Pradesh (6.06%), Jharkhand and Assam (5.07%). It is alarming that, in 2011, the Crimes against children reported a 24% increase from the previous year with a total of 33,198 cases of crimes against children reported in the country during 2011 as compared to 26,694 cases during 2010. The State of Uttar Pradesh accounted for 16.6% of total crimes against children at national level in 2011, followed by Madhya Pradesh (13.2%), Delhi (12.8%), Maharashtra (10.2%), Bihar (6.7%) and Andhra Pradesh (6.7%).

Objectives

- To assess the level of knowledge regarding child abuse among mothers before structured teaching programme.
- To assess the level of knowledge regarding child abuse among mothers after structured teaching programme.
- To find out the effectiveness of structured teaching programme on child abuse.
- To find out the association between the post test level of knowledge with the selected demographic variables.

Methodology:

In this study, pre experimental "one group pre and post test design" used to evaluate the effectiveness of structured teaching programme on knowledge regarding child abuse among mothers.

Sample and sample size

This study was conducted in Gunasa village. It is situated in Kumbherasthal, Bharatpur district of Rajasthan state. It is 18 kilometer away from the Bharatpur city. The total population of this village is 4350. This village is having nearly 500 families. There are 450 mothers having children, birth to 18 years of age.

A proportion or subset of the population is known as sample. The sample of this study consists of 50 mothers, who are having children, birth to eighteen years of age and residing in Gunasa village, Bharatpur (Rajasthan).

Sampling technique

For this study the samples were selected by using convenient sampling technique. It is a type of non-probability sampling which involves the sample being drawn from that part of the population which is close to hand. That is, a sample population selected because it is readily available and convenient.

Validity and Reliability

In order to establish the reliability of the tool, it was administered to six

DR ARCHANABEN CHUGHAN

E-mail: archanaben@uor.ac.in

It stability was obtained by Spearman correlation method. Reliability of the tool was 0.95. This tool was found highly significant and reliable.

Results

"Child is as soft as a flower"

The pre test result revealed that 36(72%) mothers had inadequate knowledge, 14(28%) had moderately adequate knowledge and none had adequate knowledge regarding child abuse.

The post test result revealed that out of 50 mothers, 15 (30%) mothers had moderately adequate knowledge, 25 (70%) had adequate knowledge and none had inadequate knowledge regarding child abuse.

Regarding causes and types of child abuse, pre and post test mean were 5.61 and 9.61 respectively, with standard deviation of 2.18 and 1.81.

Considering the assessment, management and prevention of child abuse, pre and post test mean were 6.26 and 13.04 respectively, with standard deviation of 2.92 and 2.15.

Total pre test mean and standard deviation were 11.90 and 3.76 respectively with standard error of the mean 0.53. Post test mean and standard deviation were 22.68 and 3.32 respectively with standard error of the mean 0.47.

With regards to causes and types of child abuse, mean difference and standard error of the mean were 4.00 and 0.28 respectively with SD of 1.97 and calculated t value was 14.28. It was significant at 0.05 level.

The level of knowledge about assessment, management and prevention of child abuse was significant at 0.05 level. Mean difference was 6.78 with SD of 3.42. Standard error of the mean was 0.45 with calculated t value 14.00.

While comparing the total level of knowledge between pre-test and post-test, the difference mean value was 10.78 with a standard deviation of 4.26 and calculated t value was 17.86. Standard error of the mean was 0.60. It was statistically significant at $P < 0.05$ level. This shows that there was significant increase in the level of knowledge of mothers regarding child abuse after the STR.

Association test between the post-test level of knowledge with the selected demographic variables shows the significant association between post-test levels of knowledge with educational status of mothers. The χ^2 value was 11.15. This was significant at $P < 0.05$ level. There was no significant association between the level of knowledge with age, occupation, monthly income, number of children, type of family and source of information regarding child abuse.

Objectives of the study

1. To assess the level of knowledge regarding child abuse among mothers before reviewed teaching programme.

2. To assess the level of knowledge regarding child abuse among mothers after structured teaching programme.

The overall findings of the study revealed that there was significant difference in the mean pre and post test knowledge after the structured teaching programme regarding child abuse among mothers. Hence the hypothesis stated at the beginning of this study is proved.

There was no significant association between the level of knowledge with age, occupation, monthly income, number of children, type of family and source of information regarding child abuse. This shows the significant association between post-test levels of knowledge with educational status of mothers. The χ^2 value was 11.15. This was significant at $P < 0.05$ level.

Illustrates the association between the post-test levels of knowledge regarding child abuse among mothers with the selected demographic variables.

4. To find out the association between the post test level of knowledge with the selected demographic variables.

While comparing the total level of knowledge between pre-test and post-test, the difference mean value was 10.78 with a standard deviation of 4.26 and calculated t value was 17.86. Standard error of the mean was 0.60. It was statistically significant at $P < 0.05$ level. This shows that there was significant increase in the level of knowledge of mothers regarding child abuse after the STP with under five children. And after a STP, 80% mothers have got adequate knowledge and 20% got moderate adequate knowledge.

The level of knowledge about assessment, management and prevention of child abuse was significant at 0.05 level. Mean difference was 6.78 with SD of 3.42. Standard error of the mean was 0.48 with calculated t value 14.00.

With regards to causes and types of child abuse, mean difference and standard error of the mean were 4.00 and 0.28 respectively with SD of 1.97 and calculated t value was 14.28. It was significant at 0.05 level.

The area wise distribution of difference in level of knowledge regarding child abuse among mothers between pre and post test.

Total pre test mean and standard deviation were 11.90 and 3.76 respectively with standard error of the mean 0.53. Post test mean and standard deviation were 22.68 and 3.32 respectively with standard error of the mean 0.47.

Considering the assessment, management and prevention of child abuse, pre and post test mean were 6.26 and 13.04 respectively, with standard deviation of 2.92 and 2.15.

Regarding causes and types of child abuse, pre and post test mean were 5.64 and 9.64 respectively, with standard deviation of 2.18 and 1.83.

The area wise distribution of level of knowledge regarding child abuse among mothers.

3. To find out the effectiveness of structured teaching programme on child abuse.
 Illustrates the distribution of the level of knowledge regarding child abuse among mothers during post-test. After the structured teaching program there was a significant increase in knowledge level of the mothers. Out of 50 mothers, 15 (30%) mothers had moderately adequate knowledge, 35 (70%) had adequate knowledge and none had inadequate knowledge regarding child abuse.

Conclusions

The findings of this study support the need for conducting an awareness programme regarding child abuse. The study proved that adolescent girls had inadequate knowledge regarding child abuse before. Structured teaching programme. After executing the structured teaching programme, the ndërberave improved the knowledge regarding child abuse. Such structured teaching programme distribution can be carried out in the village to improve the knowledge of mother regarding child abuse.

Recommendations

1. A same kind of study can be conducted for a larger group.
2. A comparative study can be carried out to check the level of knowledge of mothers regarding child abuse in the urban and rural area.
3. Further studies should be conducted about the attitude and practice regarding prevention of child abuse among mothers.
4. A same kind of study can be conducted to maternal, postnatal mothers, village health guide and village head to improve their knowledge level regarding prevention of child abuse.
5. An experimental study can be conducted with control group.
6. A longitudinal study can be done using post test after one month, six month and one year to see the retention of knowledge.

1. To assess the pre-test and post-test knowledge among nurses regarding transdermal electrical nerve stimulation application on pain among joint guard women.
2. To assess the effectiveness of educational packages on knowledge regarding transdermal electrical nerve stimulation application on pain among joint guard women.
3. To find out the association between the pre-test knowledge among nurses regarding transdermal electrical nerve stimulation application on pain among joint guard women with their selected demographic variables.

OBJECTIVE OF THE STUDY

THIS is a method of electrical stimulation which primarily aims to provide a degree of analgesia pain relief by exciting sensory afferent and thereby stimulating either the pain gate mechanism within the spinal system. The different methods of applying TENS relate to those different physiological mechanisms. The effectiveness of TENS varies with the clinical pain being treated, but research would suggest that when used 'well' a positive analgesic effect can be achieved. There is an extensive research base for TENS in both the clinical and laboratory settings and when the sensory gate not provide a full review of the literature, the key papers are referenced. It is worth noting that the term TENS could represent the use of ANY electrical stimulation using this surface electrode which has the intention of stimulating afferent in the clinical context. It is most commonly assumed to refer to the use of electrical stimulation with the specific intention of providing analgesia pain relief. If you do a literature search on the term TENS, you will be surprised if you come across a whole lot of other types of stimulation which technically fall into the category.

INTRODUCTION

The present study has been undertaken to assess knowledge among nurses regarding transdermal electrical nerve stimulation application on pain among joint guard women for musculoskeletal pain in both hospital/inpatient. The research design adopted for the study was pre-experimental in nature. The tool for the study was self-structured knowledge questionnaire which consists of two parts-PART-I consisted questions related to socio-demographic data, PART-II consisted of self-structured knowledge questionnaire to assess the knowledge among nurses regarding transdermal electrical nerve stimulation application on pain among joint guard women. The data was analyzed by using descriptive and inferential statistical methods. The most significant finding was that 22.7% of joint guard women were having average knowledge regarding transdermal electrical nerve stimulation application on pain among joint guard women. It was suggested that the nurses must educate joint guard women regarding transdermal electrical nerve stimulation application on pain.

Abstract

Manjula Acharya, Dr. Anu V. Kumar

An exploratory approach was used and research design for experiments on group health insurance design was used for the study. The sample consisted of 40 group health insurance members in New Delhi, India. The study was conducted with the help of computer software and administering a self-administered knowledge questionnaire by the researcher before and after insurance purchase. The test was conducted after 7 days of purchase. Data was analyzed using descriptive & inferential statistics.

METHODOLOGY

- 1. Group health insurance may have better knowledge regarding transactions related to insurance application in India.
- 2. Insurance package will improve knowledge of group health insurance regarding transactions related to insurance application in India.

ASSUMPTION

- H1: There will be no significant difference between group and non-group health insurance members on transactions related to insurance application in India among group health insurance members.
- H2: There will be significant difference between group and non-group health insurance members on transactions related to insurance application in India among group health insurance members.
- H3: There will be significant difference between group and non-group health insurance members on transactions related to insurance application in India among group health insurance members.

When the mean and SD of pre-test and post-test were compared and 't' test was applied. It can be clearly seen that the 't' value was -16.79 and a value was 0.0001 which clearly show that awareness package was very effective in learning the knowledge of post-test students.

Knowledge	Mean (T)	S.D. (t)	Std. Error of Mean	D.F.	t-value	Significance	Pre-test	Post-test
							2.77	0.42
					-16.79			0.0001

TABLE 1.1: Evaluation of awareness package by calculating Mean, SD, Mean Difference and 't' value at Pre and Post-test knowledge.

FIG-1.1: Mean (T) and standard Deviation (s) of knowledge scores.

The responses regarding mean, percentage of mean and standard deviation of post-test scores are shown in table 1.1. Knowledge in post-test was 2.77 (t) with a standard deviation of 0.42. It can be clearly seen that the 't' value was -16.79 and a value was 0.0001 which clearly show that awareness package was very effective in learning the knowledge of post-test students. It is concluded from the table of scores that there is a significant difference in mean of pre and post-test scores which clearly show the true impact objective of the present study.

 50, WARDHA ROAD, BOMBAY
 CHENNAI, TAMILNADU-600008

The result of this study indicates that there was a significant increase in the post-test knowledge score compared to pre-test score. The mean of post-test score was 17.78 and pre-test score was 13.19. The mean percentage knowledge score was 59.28% and pre-test score was 43.90%. The mean of post-test score was 17.78 and pre-test score was 13.19. The mean percentage knowledge score was 59.28% and pre-test score was 43.90%.

RESULTS

The association of occupation and score is shown in present table 1.4. The probability value for Chi-Square test is 2.78. It is not significant (p>0.05). Hence, it is inferred that occupation and score were not associated with the present study.

Occupation	CLASS	Chi-Square test	
		N=277	p<0.05 (Significance)
Professional	POOR	1	0
Professional	AVERAGE	1	0
Professional	GOOD	1	0
Business	POOR	17	0
Business	AVERAGE	1	0
Business	GOOD	1	0
Labour	POOR	12	0
Labour	AVERAGE	4	0
Labour	GOOD	1	0
Any other	POOR	2	0
Any other	AVERAGE	1	0
Any other	GOOD	0	0
Total	POOR	32	0
Total	AVERAGE	8	0
Total	GOOD	13.19	0
Total			

Table-1.4 Association of occupation with pre-test score

The association of educational status and score is shown in present table 1.5. The probability value for Chi-Square test is 1.78. It is not significant (p>0.05). Hence, it is inferred that educational status and score were not associated with the present study.

Educational Status	CLASS	Chi-Square test	
		N=158	p<0.05 (Significance)
Primary	POOR	2	0
Primary	AVERAGE	0	0
Primary	GOOD	0	0
Secondary	POOR	13	0
Secondary	AVERAGE	4	0

2. Chan, A.; Wang, T.H.; Chang, Y.C.; Peng, H.H.; Chang, S.D.; Chen, A.; Chang, C.J.; Lin, C.H.; Wang, A.M. The effect of applying transcranial electrical nerve stimulation (tENS) on motor unit firing rate during the fatigue of lower extremity muscles. *Electroencephalogr. Clin. Neurophysiol.* 2007, 117(12), 214-22.

3. Chu, T.T.; Ho, C.H.; Chiu, C.W.; Chang, D. A randomized control trial of tENS and exercise for patients with chronic low back pain. *Chin. J. Physiother.* 2007, 30(12), 820-8.

4. Davis, J.A.; Chait, P.; Fink, K.; Nelson, C.; Evans, J.M.; Swartz, W.H. Exercise with low back pain: a review of the literature. *J. Electromyogr. Kinesiol.* 2001, 11(2), 207-217.

5. Davis, B.A.; Smith, N.E.; Martin, D.C.; Schoenberg, D.R.; Rasmussen, L.S. A controlled trial of transcranial electrical nerve stimulation (tENS) and exercise for chronic low back pain. *Spine* 1992, 17(22), 2622-9.

6. Davis, J.; Smith, N.E. Transcranial electric nerve stimulation (tENS) for chronic low back pain: a pilot study. *Electroencephalogr. Clin. Neurophysiol.* 1993, 85(1), 107-11.

7. Davis, J.; Smith, N.E. Transcranial electric stimulation (tENS) for chronic low back pain. *Spine* 1992, 17(18), 2122-9.

8. Davis, J.; Smith, N.E. Transcranial electric nerve stimulation (tENS) for chronic low back pain: a pilot study. *Electroencephalogr. Clin. Neurophysiol.* 1993, 85(1), 107-11.

9. Davis, J.; Smith, N.E. Transcranial electric stimulation (tENS) for chronic low back pain. *Spine* 1992, 17(18), 2122-9.

REFERENCE:

- The study was limited to 40 female spinal workers.
- The study was limited to tENS applied to trapezius.

LIMITATIONS:

Future studies may consider an objective and when there is a need to justify findings and applying the knowledge. Furthermore, various factors including transcranial electrical nerve stimulation application on low back pain are not covered by this study. Knowledge about low back pain and knowledge about the (P-0102) is being accepted.

CONCLUSION:

That after the analysis and interpretation of data we can conclude that the hypothesis (H1) that there will be significant differences between the two groups regarding transcranial electrical nerve stimulation application on low back pain is not supported. The results of this study indicate that there is no significant difference between the two groups regarding transcranial electrical nerve stimulation application on low back pain.

Subject: Planning for blended learning/training on OSCE through mentor institute

Dear Sir/Madam,

There is a felt need for various nursing institutions to develop training or conduct knowledge & skills assessment through OSCE.

We are also planning for the blended learning/training on OSCE through mentor institutes. UPSMF has planned a virtual session on OSCE as a part of the CNPD program on 27 September, from 2pm to 3:30 pm. It is mandatory for our mentor institute capacity building team (phase 1 and phase 2) and all faculties of nursing institutions which are under CII programs (collaboration between nursing institutions and hospital) to participate the virtual session as this will form the basis for the blended training planned by UPSMF on OSCE.

Registration link: <https://forms.gle/5Y35N51015J19L25>

Registration fee: Rs. 100/- (if certificate will be provided)

For any inquiries or assistance, please do not hesitate to contact Dr. Anshu Goyal, Director, Medical Deptt. BSR, 202/179, Sardar Shiksha, 7th Floor, Lucknow.

MS. RUCHI
MISS. JYOTI SHUKLA

EYES AND BRIEFS: International Yoga Day is observed every year on June 21. The theme for the International Day of Yoga 2023 is 'Yoga for Vasudhaiva Kutumbakam' or 'Yoga for the Welfare of All as One World-One Family.' To raise awareness about this ancient practice and to celebrate the physical and spiritual prowess that yoga has brought to the world, Yoga is a practice which plays an important role in relaxing the mind and body and boosting people's immune system.

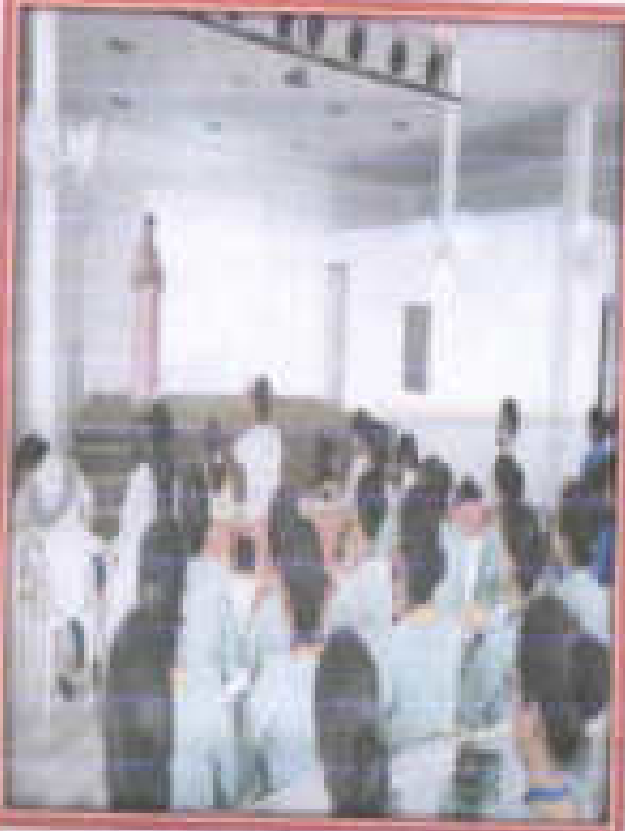

Today, on 19th June 2023, BABA EDUCATIONAL SOCIETY, INSTITUTE OF PARAMEDICAL COLLEGE OF NURSING, 56 MATIYARI DEVA ROAD, CHINHAT, LUCKNOW celebrated 9th International Yoga Day. It was attended by our faculty & Students with great enthusiasm. The seminar began with a brief introduction on Yoga Day by Mrs. Anshika & Ms. Ankita Pandey.

On this day, we organised a Posture & essay writing competition, & all students were participated actively.

All Faculties, Staff and children were taught the importance of Yoga in their life & how to maintain the harmony between body and mind. The students discussed the importance of yoga and also exhibited yoga postures and promised to introduce this activity in their daily lives.

BASIC LIFE SUPPORT TRAINING REPORT

Event Name:	Basic Life Support training for Nursing Students
Date:	18.04.2023 to 19.04.2023
Venue:	Auditorium, Baba Educational Society
Participants:	All Nursing Faculty & All Nursing Students
No. Of Attendees:	447
Name of the trainer:	Mr. Himanshu Joshi, Medanta Hospital, Gurgaon

Event Brief & highlights:-

Basic Life Support, or BLS, generally refers to a level of medical care which can be provided by trained medical personnel, including emergency medical technicians, paramedics, and by qualified bystanders for victims of life-threatening illnesses or injuries until they can be given full medical care at a hospital.

College of Nursing, Baba educational society and Medanta Hospital, Gurgaon jointly organised two days basic life support Session on 18/04/2023 and 19/04/2023 from 10am to 5pm, which was conducted by experts from Medanta hospital, Gurgaon. Around 447 participants including College of Nursing Faculties and students of all the programs (B.Sc. Nursing, G.N.M. and A.N.M.) actively participated and updated their knowledge on Paediatrics/ Adult BLS With appropriate hands on skills.

The Session was started at 10:00am, in Auditorium with Introductory Session by Mrs. Jayana Kr. Rupjee, HOD, Dept. Of Obstetrics and Gynecology Nursing.

Dr. Archana Chouhan, Principal, Baba College of Nursing, welcomed the resource persons and the delegates. Mr. Himanshu Joshi explained about cardiac arrest

DR. ARCHANA CHOUHAN

and heart attack. He then explained the 7 important steps while performing CPR. He also Demonstrated about (AED) automatic emergency defibrillator and explained about its uses. He then Demonstrated on Paediatrics CPR. The delegates then divided into two teams and team 1 had sessions on Paediatrics BLS, dealt by Mrs. Anjali and Mrs. Farheen. At the same time, team 2 had sessions on Adult CPR dealt by Mrs. Durba and Mrs. Manila.

After the delicious lunch, a theoretical and practical evaluatory session was held for the participants. Feedback was obtained from the faculties and the students, they assured that they shall utilize the skill gained whenever and wherever needed in the clinical setting and they also addressed that the programme was highly beneficial to them. At the end of the session, certificate was distributed to the participants.

Mrs. Durba Ganguly, assistant professor, college of nursing, delivered the vote of thanks and the gatherings dispersed at 4.30 pm.
